

CSC343 Assignment 3 Part 2

Lingjing Zou, Jiahui Yao

1.

Consider a relation A with attributes LMNOPQRS with functional dependencies D:

$D = \{ L \rightarrow NQ [a], MNR \rightarrow O [b], O \rightarrow M [c], NQ \rightarrow LS [d], S \rightarrow OPR [e] \}$

1.a)

$L \neq NQLSOPRM [a]$

$MNR \neq OMNR [b]$ violation

$O \neq OM [c]$ violation

$NQ \neq LSNQOPRM [d]$

$S \neq OPRM [e]$ violation

Therefore, $MNR \rightarrow O$, $O \rightarrow M$, and $NQ \rightarrow LS$ violate the BCNF.

1.b)

We start BCNF decomposition from [b] $MNR \rightarrow O$ and then we have:

R1: OMNR

R2: LMNPQRS

In R1 we have: $O \neq OM(O \rightarrow M)$, $M \neq M$, $N \neq N$, $R \neq R$ and $O \rightarrow M$ violate BCNF, then in next decomposition:

R3: ONR

And we have $O \neq OM(O \rightarrow M)$, $N \neq N$, $R \neq R$, no FDs violate BCNF and we stop here.

R4 : OM

And we have $O \neq OM(O \rightarrow M)$ and $M \neq M$, no FDs violate BCNF and we stop here.

In R2 we have $L \neq LNQSOPRM$, $M \neq M$, $N \neq N$, $P \neq P$, $Q \neq Q$, $R \neq R$ and $S \neq SOPRM$, we find that $S \rightarrow OPRM$ violates the BCNF, then in next decomposition:

R5: SOPRM

And we have $O \twoheadrightarrow OM(O \rightarrow M)$, $S \twoheadrightarrow SOPRM(O \rightarrow OPRM)$, $P \twoheadrightarrow P$, $R \twoheadrightarrow R$, $M \twoheadrightarrow M$ and $O \rightarrow M$ violates the BCNF, then in the decomposition we have:

R7: OM

And we have $O \twoheadrightarrow OM$, $M \twoheadrightarrow M$, no FDs violate BCNF and we stop here.

R8: OPR

And we have $O \twoheadrightarrow M$, $P \twoheadrightarrow P$, $R \twoheadrightarrow R$, no FDs violate BCNF and we stop here.

R6: LNQS

And we have $L \twoheadrightarrow NQLSOPRM(L \rightarrow NQS)$, $N \twoheadrightarrow N$, $Q \twoheadrightarrow Q$, $S \twoheadrightarrow OPRM$, no FDs violate BCNF and we stop here.

Therefore from the BCNF decomposition:

In the final decompositions we have LNQS($L \rightarrow NQS$), OPR(\emptyset), ONR(\emptyset), OM($O \rightarrow M$).

2.a)

Compute a minimal basis for T

Step1: We split the LHS of each FD

$AB \rightarrow C$, $C \rightarrow A$, $C \rightarrow B$, $C \rightarrow D$, $CFD \rightarrow E$, $E \rightarrow B$, $BF \rightarrow E$, $BF \rightarrow C$, $B \rightarrow D$, $B \rightarrow A$

Step2: Reduce LHS

$A \rightarrow B, B \rightarrow C$, then we reduce $AB \rightarrow C$ to $B \rightarrow C$

$CF \rightarrow E, CF \rightarrow D$, then we reduce LHS of $CFD \rightarrow E$ to $CF \rightarrow E$

$B \rightarrow C, C \rightarrow A, C \rightarrow B, C \rightarrow D, CF \rightarrow E, E \rightarrow B, BF \rightarrow E, BF \rightarrow C, B \rightarrow D, B \rightarrow A$

Remove excessive FDs:

Remove $B \rightarrow C$:

$B \rightarrow A, B \rightarrow D$ we cannot remove

Remove $C \rightarrow A$:

$C \rightarrow B, C \rightarrow D$ we can remove this $C \rightarrow A$

Remove $C \rightarrow A$ & $C \rightarrow B$:

$C \rightarrow D$ we cannot remove this

Remove $C \rightarrow A$ & $C \rightarrow D$:

$C \rightarrow B, C \rightarrow E$ we can remove this $C \rightarrow D$

Remove $C \rightarrow A$ & $C \rightarrow D$ & $CF \rightarrow E$:

$CF \rightarrow B, CF \rightarrow D, E \rightarrow B$ we can remove this $CF \rightarrow E$

Remove $C \rightarrow A$ & $C \rightarrow D$ & $CF \rightarrow E$ & $E \rightarrow B$:

$E \rightarrow C$ we cannot remove this

Remove $C \rightarrow A$ & $C \rightarrow D$ & $CF \rightarrow E$ & $BF \rightarrow E$:

$BF \rightarrow C, BF \rightarrow D, A \rightarrow C$ we cannot remove this

Remove $C \rightarrow A$ & $C \rightarrow D$ & $CF \rightarrow E$ & $BF \rightarrow C$:

$BF \rightarrow D, A \rightarrow C$ we can remove this $BF \rightarrow C$

Remove $C \rightarrow A$ & $C \rightarrow D$ & $CF \rightarrow E$ & $BF \rightarrow C$ & $B \rightarrow D$:

$B \rightarrow BAC$ we cannot remove this

Remove $C \rightarrow A$ & $C \rightarrow D$ & $CF \rightarrow E$ & $BF \rightarrow C$ & $B \rightarrow A$:

$B \rightarrow BDC$ we cannot remove this

Step 4 Final Answer:

$B \rightarrow A$, $B \rightarrow C$, $B \rightarrow D$, $BF \rightarrow E$, $C \rightarrow B$, $E \rightarrow B$

2.b)

Compute all keys for P:

Since F,G,H are not in RHS, then they are in every key,

A,D are not in RHS and not in LHS, then they are in no key,

B,C,E are in both RHS and LHS, so we must check them.

To check BCE:

Case 1(B) : $FGHB \neq FGHBACED$ contains all attributes

Case 2(C): $FGHC \neq FGHCBAED$ contains all attributes

Case 3(E): $FGHE \neq FGHEBCDA$ contains all attributes

Since we find three key with B, C, E, we don't need to check their combinations such as BC, CE, BE.....; since they will always be superkeys.

Then $FGHB$, $FGHC$, $FGHE$ are keys.

2.c)

3NF synthesis

Combine FDs with same LHS:

$B \rightarrow ACD$

$C \rightarrow B$

$E \rightarrow B$

$BF \rightarrow E$

For each FD in minimal basis, define a new relation:

R1: {B,A,C,D}

R2: {C,B}

R3: {E,B}

R4: {B,F,E}

Since R3 is R4 and R2 is R1, so we only keep R4 and R1.

Because no relation is super-key (no G, H), add relation whose schema is key:

R1: {B, A, C, D}, R4: {B, F, E}, R5 {F, G, H, B}

2.d)

Because we formed each relation from an FD, the LHS of those FDs are indeed superkeys for their relations. However, there may be other FDs that violate BCNF and therefore allow redundancy. Then we need to project the FDs onto each relation.

We can see $E \rightarrow B$ will project onto R4 and $E \neq EBACD$ so E is not a superkey of the relation R4. Therefore yes, the schema will allow redundancy.
